

Measuring For a Sliding Screen Door

This page is designed to assist you in measuring for sliding screen screens. While we will assist you, the final measurements will be your responsibility. The simplest way of measuring is to measure your existing screen door. Provide the width and length of the overall frame. If you do not have a screen to measure and you live in an apartment or tract housing you may be able to measure a screen from your neighbor who has the same door size.

If you do not have a door to measure here are the two most common track set ups.

Option A: Measure from tip of track to tip of track and add 1/8" to overall height.

Option B: Measure from top of bottom track up 1/4" into the top U Channel.

We also sell tracking if you do not have tracks. Please refer to our sliding screen door track page online.

Please keep in mind we ask for 1/8" tolerance when manufacturing sliding screen doors. There are rollers on the top and bottom of the door frame that can be adjusted with adjustment screws to help you install the door and to get a good fit.
